HSBC SELECT EQUITY MUTUAL FUND

Information about the UCITS

Asset management company

HSBC Global Asset Management (France)

Custodian and Depository:

Caceis Bank

Appointed accounting manager:

CACEIS Fund Administration

Auditor

Ernst & Young Audit

Legal form:

Mutual fund (FCP) governed by French law

Management objective

The objective of the mutual fund is to offer diversified and active management essentially on equity markets over a minimum 5 year investment horizon. Though fluctuating within wider allocation constraints, the mutual fund profile may be compared with an allocation typically composed of 95% equities and 5% corporate and government bonds, invested in developed markets via the euro as well as emerging ones.

Benchmark

This mutual fund does not have a benchmark. Hence, we believe there is no representative benchmark for our investment management process or our investment universe.

Investment strategy

1. Strategies:

The investment strategy is discretionary and relies on a portfolio management process organised around 3 pillars:

HSBC SELECT EQUITY MUTUAL FUND

- a strategic allocation of long-term assets, based upon both the certitude that the mutual fund manager has about the various asset classes, geographic area, and management style, as well as the HSBC Group advisory teams in building and optimising portfolios.

This allocation is set within minimum and maximum exposure constraints by potentially attainable asset classes according to certain market configurations.

- a tactical short-term allocation illustrating the certitude managers have about different asset classes, with particular leveraging of potential market inefficiencies and opportunities. It provides reactivity and flexibility to strategic allocation, thus optimising global portfolio exposure.
- a selection of investment vehicles most likely to offer the best exposure sought.

The mutual fund manager relies principally upon HSBC Group expertise, as well as active mutual fund management and index and/or tracker investment funds.

In context of the selection of securities and pursuant to management forecasting, eurozone instruments may be favoured.

The mutual fund may invest up to all its assets in other funds, principally managed by the HSBC Group.

The net assets of the mutual fund shall then be 85-100% exposed to equity markets, and 0-15% exposed to interest rate markets.

2. Assets (excluding embedded derivatives):

Equities:

None.

Debt securities and money market instruments:

While not authorised to do so, the mutual fund may invest directly in short- or medium-term debt securities or bonds, up to 10% of the net assets and under the same rating conditions as those stipulated in the "interest rate product investment fund" compartment.

Other investment fund units or equities: up to all of its net assets, including:

- French or European UCITS: 70-100%
- French and European retail investment funds (RIFs) and hedge funds meet 4 criteria of Article R214-13 of the Financial and Monetary Code: 30% maximum.

This threshold includes index and/or tracker investment funds.

Investment funds selected are exposed to different asset classes, e.g., equity, interest rate products, and money market, and managed principally by the HSBC Group.

HSBC SELECT EQUITY MUTUAL FUND

Investment fund equities:

Pursuant to management forecasting, the equities compartment may vary and represent between a minimum of 85% and a maximum of 110% of assets of the mutual fund.

However, pursuant to market conditions, global exposure of the mutual fund to equity risk may fluctuate between 50-110% of assets of the mutual fund through use of financial futures for hedging or exposure purposes.

The equities compartment is composed of investment fund units or shares exposed to equities of corporations which are capitalised in any proportion (including small and medium with no predetermined limit), sector, and geographic area (including emerging markets with no predetermined limit).

Interest rate product investment funds:

The rate compartment may represent up to 15% of mutual fund assets, with no predetermined minimum. It is invested in units or shares of interest rate product investment funds (bonds and monetary) divided among European and international government bonds, investment grade (within minimum Standard & Poor's BBB- and Moody's Baa3 ratings or the equivalent as set by the management company) as well as high-yield (riskier securities due to their low ratings) European and international corporate bonds, and European and international convertible bonds.

The management company does not exclusively or automatically use ratings provided by credit rating agencies and favours its own credit risk analysis to assess the credit quality of assets and in the selection of securities to purchase or sell.

Regarding the interest rate compartment, investments in high-yield bonds and emerging market debt are authorised without the maximum represented in the interest rate compartment.

Diversified and/or flexible investment funds:

The diversified compartment may represent up to 15% of mutual fund assets, with no predetermined minimum.

It is invested in units or shares of diversified and/or flexible investment funds, particularly those with absolute return strategies, which is defined as management decoupled from traditional markets.

The mutual fund may also invest with no predetermined limits in index and/or tracker investment funds to augment equity or rate exposure, or diversify the portfolio within other asset classes (real estate, etc.), geographic areas, or management styles.

The index and/or tracker investment funds selected are French or European UCITS or hedge funds.

HSBC SELECT EQUITY MUTUAL FUND

Allocation constraints:

The strategic allocation benchmark determines the allocation of medium/long-term investments by asset classes:

Types of investment funds	Minimum allocation (investment thresholds)	Maximum allocation (investment thresholds)
Equities	85%	110%
Rates (bonds and monetary)	0%	15%
Diversified and/or flexible	0%	15%

3. Derivatives:

Forward financial instruments:

The mutual fund may carry out transactions involving financial futures traded on French and foreign regulated markets or OTC markets.

In seeking to achieve the management objective, the aim of the use of financial futures is to hedge and/or expose the mutual fund to interest rate and equity risk as well as to hedge exchange rate risk.

For exposure purposes, strictly to achieve the management objective, the mutual fund may use:

- options, and interest rate futures and swaps in context of portfolio exposure to interest rate fluctuations;
- equity index options and futures in context of portfolio exposure to equity risk;
- currency forwards in context of portfolio exposure to currency fluctuations other than the euro.

For hedging, the mutual fund may use:

- options, and interest rate futures and swaps to hedge interest rate risk;
- equity index options and futures, to hedge equity risk;
- currency options, swaps and futures, to hedge currency fluctuation other than the euro;

The Fund shall not use any total return swaps.

The mutual fund shall likely use volatility derivatives, especially volatility index futures, e.g. US and European equity market volatility indexes (respectively VIX and VSTOXX futures) in purchasing and selling up to 3% of fund net assets.

Counterparties eligible for transactions on OTC financial futures are selected according to the procedure described in the paragraph: "Brief description of the intermediary selection procedure."

Financial collateral used for OTC financial futures is the subject of a financial collateral policy available on the management company's website.

HSBC SELECT EQUITY MUTUAL FUND

These transactions may be completed with counterparties selected by the management company among the financial establishments whose registered offices are located in an OECD member state. These counterparties may be companies affiliated with HSBC Group.

These counterparties must have trustworthy credit, and regardless, the minimum Standard & Poors rating of BBB-, the equivalent, or a rating deemed equivalent by the management company.

This financial collateral policy specifies:

- The haircut applicable to financial collateral. This depends on the volatility of the security which is characterised by the type of assets received, the rating, the maturity of the security etc. The effect of the haircut is to request financial collateral greater than the market value of the financial instrument.
- Assets accepted as collateral that can be made up of cash, government securities, certificates of deposit, and debt securities/bonds issued by private issuers.

Financial collateral other than cash may not be sold, reinvested or pledged. Bond securities must have maximum maturity of 50 years.

Financial collateral made in cash must be:

- deposited in credit establishments whose registered offices are in an OECD member nation or a third party country with equivalent reserve regulations,
- invested in high quality government bonds,
- invested in reverse repurchasing agreements whose counterpart is a credit establishment subject to reserve monitoring, and from which the UCITS may withdraw cash at any point, and
- invested in short-term money market funds.

Financial collateral discounts in the form of securities and/or cash are held in distinct accounts by the custodian.

4. Securities embedded with derivatives:

None.

5. Deposits:

The mutual fund may invest up to 20% of its assets in Euro deposits for total duration equal to or less than 3 months to replenish its liquid assets.

6. Cash loans:

The mutual fund may resort to cash loans of up to 10% of its assets. Cash loans strictly cover current account shortfalls resulting from a gap between subscription and buyback transactions within unit trusts.

7. Temporary purchases and sales of securities:

The mutual fund may have incidental recourse to temporarily sell and purchase securities. Repo and reverse repo agreements are favoured in managing cash flow. Temporary purchases and sales are limited to 10% of committed assets.

HSBC SELECT EQUITY MUTUAL FUND

Category of transactions used:

- repo and reverse repos in reference to the French Monetary and Financial Code;
- borrowed and loaned equities in reference to the French Monetary and Financial Code;

Category of investments:

Temporary purchase and sales of securities are carried out to achieve the management objective and in the best interest of the UCITS. Only debt instruments may be the subject of temporary purchases and sales of securities.

These transactions aim to:

Repos and reverse repos: to manage UCITS residual cash flow related to subscriptions/buybacks and optimise income.

For protection against default of a counterparty, temporary purchases and sales of securities may provide for financial collateral discounts in the form of securities and/or cash which are held in distinct accounts by the depository. These conditions are stipulated in the section "Derivatives."

These transactions may be completed with counterparties selected by the management company among the financial establishments whose registered offices are located in an OECD member state. These counterparties may be companies affiliated with HSBC Group.

These counterparties must have trustworthy credit, and regardless, the minimum Standard & Poors rating of BBB-, the equivalent, or a rating deemed equivalent by the management company.

- potential capital leverage: up to the commitment calculated by the probabilistic method in absolute VaR.
If the fund is invested in futures markets, its global risk level shall be calculated regarding the absolute VaR as defined below in Part VI. Global risk.
- compensation: additional information is available under Charges and commissions.

Risk profile

Risk related to discretionary management:

The management objective of the mutual fund relies on discretionary allocation which hence includes the risk that the mutual fund may not be consistently invested in the top performing markets or assets.

Capital loss risk:

The UCITS has no guarantee or protection. Therefore, initially invested capital remains at risk.

Equity risk:

A decrease in the price of equities may lead to a decrease in the mutual fund's net asset value (NAV). During periods of high equity market volatility, the NAV may decrease due to potential fund exposure to these same markets.

Subscribers are advised that small cap markets include companies which, due to their low capitalisations, may fluctuate, and hence decrease the value of investments of the mutual fund.

HSBC SELECT EQUITY MUTUAL FUND

Emerging market risk:

Equity and credit risk are increased through investments in emerging countries whose markets may be more volatile and more rapidly fluctuate than large international ones.

Interest rate risk:

The portion of the portfolio invested in interest rate products may be impacted by interest rate fluctuations. When long-term interest rates increase, bond prices fall. These movements may impact the part of the mutual fund invested in bonds, and cause a decline in the NAV.

Credit risk:

When interest rate products are invested in securities issued by private issuers, the potential risk of the deterioration of the issuer's standing may negatively impact the price of the security and decrease the Fund NAV.

Moreover, subscribers are advised that investing in low or unrated (high-yield) securities involves increased credit risk which may lower the mutual fund NAV.

Convertible bond investment risk:

The value of convertible bonds relies on many factors: interest rate levels, changes in the price of underlying equities, changes in the price of the derivative within the convertible bond. These different elements may decrease the UCITS NAV.

Forex risk:

Forex risk consists of the risk of a change in an asset's currency in relation to the mutual fund's reference currency, namely the euro. This may occur through the purchase of instruments issued in currencies other than the reference currency of the mutual fund. Consequently, the Fund NAV may decrease.

The mutual fund may incur forex risks of up to 75% of its assets.

Forward financial instrument risk:

The use of futures may increase or decrease the volatility of the mutual fund, and impact its NAV, in either direction.

Related risks:

Counterparty risk:

The UCITS is exposed to the counterparty risk resulting from the use of OTC financial futures and temporary purchases and sales of securities. This is the risk that the counterparty with which a contract has been made will not meet its obligations, e.g., delivery, payment, repayment, etc.

In this case, the counterparty's breach may decrease the Fund NAV. This risk is reduced by the establishment of financial collateral between the mutual fund and the counterparty, as described in the investment strategy.

Risk of potential conflicts of interest:

The risk of conflict of interest, as part of transactions on financial contracts and/or temporary purchases and sales of securities, may exist when the intermediary used to select a counterparty, or the counterparty itself, is linked to the management company (or the custodian) by a direct or indirect equity link. The management of this risk is described in the

HSBC SELECT EQUITY MUTUAL FUND

“Conflict of interest policy” established by the management company and available on its website.

Risk related to management of financial collateral:

The unitholder may be exposed to legal risks (in line with legal documentation, execution of contracts and the limits within them), transactional risks, and risks related to the reuse of cash received as collateral. The mutual fund NAV may change due to fluctuations of the value of securities purchased for investment from cash received as collateral. Due to exceptional market circumstances, the unitholder may also be exposed to liquidity risk involving, for instance, difficulties trading certain securities.

Calculation and allocation of the distributable amounts

In accordance with the regulatory provisions, the net income for the financial year is equal to the amount of interest, arrears, dividends, premiums, bonuses, and directors’ fees, as well as all income relating to securities that constitute the Fund’s portfolio, plus income from temporary cash holdings, minus management fees and borrowing costs.

Sums distributable by a UCTIS consist of:

1. The net income increased by retained earnings and plus or minus the balance of accrued income;
2. Capital gains realised, net of costs, minus capital losses realised, net of costs, recognised during the financial year, plus net capital gains of the same type recognised during earlier financial years that were not the subject to any distribution or accumulation, and minus or plus the balance of accrued capital gains.

The amounts indicated in points nos. 1 and 2 above may be distributed independently of each other, entirely or partially.

Distributable amounts	Units A, H and B
Net earnings (1)	Accumulation
Net capital gains (2)	Accumulation

Investment rules

The mutual fund complies with the investment rules defined in Articles L. 214-4 and R. 214-1 et seq. of the French Monetary and Financial Code.

Global risk

The method retained for calculating global risk is absolute VaR.

HSBC SELECT EQUITY MUTUAL FUND

Details about calculating global risk of the UCITS:

This calculation is made through determining the value at risk (VaR) of a UCITS, defined as the maximum loss that it can endure over a given period with a determined probability called the “confidence level.”

Hence, as calculated by the sum of par values of financial contracts used, the indicative leverage level of the UCITS is 45%.

The maximum, minimum, and average risk levels are stipulated in the Fund annual report.

HSBC SELECT EQUITY MUTUAL FUND

Activity report

Macroeconomic overview

During the first quarter of 2019, leading indicators in the United States, Europe as well as China and Asia suggested a downturn in economic activity, subsequently confirmed by a deterioration in exports and industrial production, notably in the eurozone. The decline in the manufacturing sector was pronounced in Germany, exposed to new environmental requirements in the automotive sector, and a slowdown in global trade and demand from China and the United Kingdom, but also recessions in Italy and Turkey. The OECD further reduced its global growth forecast to 3.3% in 2019 versus 3.6% in 2018, maintaining its warning of downside risks in its forecasts. Indeed, the extended uncertainty tied to Brexit and the American trading policy, coupled with the tax cuts in Italy encumber the search for safe havens, with employment and consumption risk in sight. Hence for its 2019 forecast, the OECD strongly downgraded the eurozone from 1.0% versus 1.8% last November, hampered by Germany, 0.7% versus 1.6% initially, and the Italian recession, -0.2% versus 0.9% initially expected. In the United Kingdom, the reduction in investments in the fourth quarter tied to Brexit contributed to a deterioration in the 2019 growth outlook, 0.8% versus 1.4% initially. Finally, the Chinese authorities lowered the 2019 growth target from "around 6.5%" to "approximately 6%-6.5%," announcing a further tax stimulus (2% of GDP in 2019) with a reduction in the VAT paid by the manufacturing, construction and transport sectors, and support for infrastructure investments. Faced with its weakening economy, Beijing began making concessions toward a trade agreement with the United States, notably on six American demands regarding technology transfers, IP protection, market access, yen policy, agriculture and removing tariff barriers. In a context of economic slowdown, the large central banks reacted with an increase in monetary policy support. On 4 January 2019, the Chairman of the Federal Reserve Mr Powell declared that monetary policy was adjustable if necessary, and that flexibility applied to both Fed fund rates and changes to its balance sheet. On 15 January, it was the European Central Bank's (ECB) turn, with its Chairman Mr Draghi indicating an increase in downside risks on the economic horizon, and insisting on various supportive measures still available if necessary. On 23 January, the Bank of Japan lowered its inflation forecast, and reaffirmed its commitment to purchase government bonds to keep the 10-year yield on track. Finally, the People's Bank of China lowered its required reserve ratios again for banks, confirming a supportive policy for bank credit, notably for small and medium-sized companies and the private sector. In March, this prudent support was followed by more accommodation than originally anticipated, with the ECB modifying its forward guidance to indicate its rates as unchanged in 2019. The ECB also announced the implementation of numerous liquidity facilities for banks, including a new series of refinancing operations, "Targeted Long-Term Operations III" (TLTRO III), to incentivise bank lending. Finally, on 20 March the Federal Reserve revised its GDP growth outlook from 2.1% for 2019 versus 2.3%, signalling a pause in Fed fund rate increases, and declaring that its balance sheet roll-off process would be completed by end September.

HSBC SELECT EQUITY MUTUAL FUND

During the second quarter (Q2) of 2019, the world economy showed signs of weakening in the wake of rising Chinese-American protectionism. Indeed, the highly expected agreement between United States and China was not concluded, notably due to dissensions on the subject of industrial subsidies and IP protection. In early May, the United States increased tariffs from 10% to 25% on US\$200 billion of Chinese imports, though without definitively closing the door to a trade agreement. Then China retaliated with new tariffs between 5%-25% on US\$60 billion of American products. If the tensions persisted, the impact on global growth through both trade as well as confidence would be palpable. The risk then of overly weak economic growth would then impede developing countries from lowering unemployment and in short order renewed inflation. Economic indicators during the quarter also confirmed that such a scenario had become increasingly plausible. Hence American inflation as measured by the core personal consumption expenditures (PCE) price index had declined since January, from 2% a/a to 1.6% a/a in May, and net jobs created slowed from 149.5k on average between April-May versus 153k in the first quarter, and 223.2k on average in 2018. In China and emerging countries, economic indicators were unfavourable overall. Purchasing manager's indicators (PMI) along with trade statistics deteriorated in China and Asia (notably South Korea and Singapore). In China, the figures in May for investments, industrial production and imports were disappointing despite rising retail sales and exports, probably tied to front-loading prior to rising tariffs. Particularly exposed in China, the European manufacturing sector was already weak as particularly due to Brexit, the situation is paralysed. The decision made by the European Union and the United Kingdom to postpone the Brexit date to 31 October 2019 (30 March 2019 initially), then the resignation of the Prime Minister followed by a voting process within the Conservative Party to succeed her fed uncertainty around reaching a trade agreement. Given the industrial recovery, both the service sector and consumer consumption have though been well positioned in Europe, with the pursuit of lower unemployment in the eurozone (7.5% in May, its lowest level since July 2008) and a rise in wages (2.2% a/a in Q1, the highest since 2012). However inflation in the eurozone remained contained, notably core inflation between 0.8%-1.3% this quarter. In this modest growth and inflationary environment, with higher downside risks on the horizon as well, the central banks mostly have been much more accommodating in Q2, both in developed countries (notably the United States, the eurozone, Australia and New Zealand) as well as emerging economies (India, the Philippines, Malaysia, Russia and Chile). The Fed signalled its support at numerous points, notably during a Chicago conference on the review of the monetary policy context. The Fed chairman, Jerome Powell, indeed declared on 4 June that the Fed would "act as appropriate to sustain the expansion with a strong labour market and inflation near its 2 percent objective," suggesting increased openness to lowering rates pre-emptively in a manner comparable to the 1995/96 and 1998 episodes. Then the meeting of the Federal Open Market Committee (FOMC) from 18-19 June revealed that 7 of its 18 members favoured lowering rates by 50 basis points in 2019 (and another assuming -25 basis points). The new median forecast of Fed rates was lowered from -50 basis points to 2.125% at end 2020 instead of 2.625%, and 2.375% at end 2021 instead of 2.625%. Finally, the median forecast of long-term Fed rates is now estimated at 2.5% from 2.8% previously, showing that the Fed's accommodating shift responds to structural considerations of the American economy. The ECB also issued an explicitly accommodating statement during its meeting of 6 June. Beyond the unchanged rates through June 2020, versus end 2019 previously, and relatively beneficial conditions for the TLTRO III, the ECB notably declared that it is "determined to act in case of adverse contingencies."

HSBC SELECT EQUITY MUTUAL FUND

During the press conference which followed, the President of the ECB Mario Draghi stipulated the options discussed within the Council: new rate reductions, resuming quantitative easing, or additionally a more symmetrical interpretation of the inflation objective (currently "less but close to 2%.") During the Forum on Central Banking in Sintra, Mr Draghi clearly pleaded on 18 June in favour of an "additional stimulus" if the eurozone outlook darkens, and if the expected return of inflation to the ECB objective is threatened.

Financial overview

During the first quarter of 2019, the more accommodating than expected pivot of the large central banks, the signs of progress in Chinese-American trade negotiations, and the additional tax stimulus in China translated on the financial markets into a renewed buying spree in all asset classes, with resilience from losses incurred in December. At end 2018, the financial markets were deeply troubled by the relative weakness of liquidity tied in part to timely regulatory declarations (causing a surge in transactions at the end of the period), making them vulnerable to unforeseen events. Hence in the first quarter of 2019 (Q1), the MSCI Index (local currency) reached 12.8% for developing country markets, followed by emerging market ones (9.9%). The best market performance occurred in China (MSCI 18%), then in the United States (13.9%) and the eurozone (12%). The uncertainty tied to Brexit and the slowing of global trade weighed on equity performance in the United Kingdom (9.4%) and Japan (7.8%). Emerging markets benefited from the buying spree, but performing ultimately weaker than in developed markets. Despite the Fed's more accommodating shift, and some additional latitude for central certain central banks (notably India, Mexico, and Brazil), investors were especially finicky, with modest gains in Brazil (8.7%), India (6.3%), South Africa (4.8%), Mexico (4%), and Turkey (3%). Russian equities (12.2%) and the rouble (12.2% against the dollar) bounced back in the wake of rising oil prices (Brent 27.1% to US\$68.4/barrel) after a sharp decline the prior quarter. The black gold benefited from confirmed production cuts by Saudi Arabia, and the announcement of a likely extension of the agreement between OPEC and its allies beyond June, until end 2019. On currency markets, the US dollar tightened (1.2% in Q1), the Chinese yen rose 2.5% against the US dollar as well as the British pound sterling (2.2% in Q1). In a countertrend, the euro declined -2.2% against the US dollar as well as the Swiss franc and the Chinese yen (-1.4% for both). The Turkish lira remained under pressure (-5% against the US dollar) as well as the South Korean won (-2.1%), the Brazilian real (-1.0%) and the South African rand (-1.1%). The recovery of global markets was accompanied by a bond market rally, with a sharp drop in yields and credit spreads. For the first time since early 2018, bond funds recorded substantial yields, motivated by the search for returns. The credit spreads on corporate bonds diminished, notably in the high-yield segment in the United States and the eurozone. On sovereign debt, the 10-year German rate declined anew at -0.07% at end March 2019 (-57 basis points in Q1), approximating its lowest historic point of 2016, and thus joining the club of countries with negative 10-year rates (-0.43% in Switzerland and -0.10% in Japan). On the markets bordering the eurozone, sovereign risk indicators declined except in Italy, where the yield spread of Italian government bonds in relationship to the German Bund fluctuated between 250-290 basis points despite a net drop from the prior autumn when the proposed budget of the Italian government was announced. The 10-year American T-Bond rate fell from -23 basis points to 2.41% end March, and for the first time since 2007 with a slight inversion of the 3 month/10-year curve. This drop in prime rates at the end of the quarter seemed to reflect renewed demand for safer assets, owing to a certain prudence in light of the efficacy of tax and monetary policy turnabouts on the growth and inflation dynamic.

HSBC SELECT EQUITY MUTUAL FUND

In the second quarter (Q2) of 2019, the evidently more accommodating change of course by the central banks strongly supported all asset classes. On equity markets, the MSCI Global ¹ Index (in local currency) rose to 3.4% in Q2, with an over performance of developed markets, notably the United States (MSCI 4.3%) and in the eurozone (MSCI 7%), particularly Germany (DAX index up 8.5%) and France (CAC40 4.6%), and this despite a decline in Japan (MSCI -1.6%). On emerging equities markets, trade tensions fed an aversion to risk in Asia. The fall of Chinese equities (MSCI -4.2%) was only partially compensated by strong rebounds in Russia (MSCI 17.3%), Brazil (MSCI 7.2%) and in South Africa (MSCI Indexes 6.8%). On the bond market, both sovereign debt and credit yields and spreads collapsed in the wake of declines in anticipation of Fed rates. In the United States, the Fed Funds futures rate integrated four rate drops between now and end 2020, including nearly 3 from now until end 2019. In the eurozone, futures also included a deposit rate drop between now and the end of the year, but with a less likelihood in the United States. Despite the very accommodating shift of the Fed and the ECB, five-year inflation forecasts set new records in the eurozone (1.14% on 17 June, reaching 1.21% on 30 June from 1.35% end March) and continued to decline in the United States (-18 basis points to 2.04%). These developments signalled an unhinged risk about the inflation outlook, and a weakening of the credibility of monetary policy to be able to sustainably revive inflation. Sovereign 10-year bond rates fell in the United States (-40 basis points to 2.01%), and reached historic lows in Germany (-26 basis points to 0.33%) and France (-32 basis points to -0.1%), but also at the eurozone periphery (strong declines in 10-year yields in Spain and Portugal, respectively -70 basis points to 0.40% and -77 basis points to 0.48%). Reduced short-term rate forecasts sustained return-seeking, notably favouring implementation of carry trades² on both eurozone and emerging market peripheral debt securities and on high-yield credit. Rate curves in the eurozone were generally flat, via a steep drop in the long parts, and peripheral securities spreads declined significantly against the Bund. Only the Italian BTP 10-year yield declined more modestly (-39 basis points to 2.10%), along with its spread against the Bund (-13 basis points to 243 basis points), hurt by the risky tax cuts. On the currency and raw materials markets, the lack of clarity on the trade agreement front penalized the Chinese yen (-2.5% against the US dollar in Q2), but also the pound sterling (-2.6% against the US dollar, and -3.9% against the euro), all reinforcing the appetite for gold (9.1%), the yen (2.7%) and the Swiss franc (2.0%). Finally, the price of WTI crude (-1.4% to US\$58.5 end June) fluctuated strongly (between US\$51.1-66.3 this quarter) in the wake of geopolitical uncertainty (escalating tensions between the United States and Iran), and the risks impacting global demand.

Source: Bloomberg data at 28/06/2019.

¹ MSCI Index expressed in local currency.

² A “carry trade” consists of taking advantage of yield spreads, for instance borrowing in a currency with a lower interest rate, then investing the corresponding funds in a higher interest rate asset.

HSBC SELECT EQUITY MUTUAL FUND

Management policy

Asset Allocation

The early year economic environment and market valuations made equity markets more attractive than bonds. And despite May's correction, our overexposure proved lucrative over the half-year. The portfolio was exposed to equities by 95% during the first half-year, with routine profit taking. Over the medium-term, we favour overexposure in risky assets, especially equities over eurozone government bonds. We maintain a flexible exposure which typically fluctuates between 91%-101% on equities. We are less sensitive to changes in government bonds yields. Concerning private credit, we have profit taken from the high-yield segment during the first quarter to favour the investment credit category.

Geographic allocation (equity compartment)

Based on 100% of equities, the European preponderance varied with an approximate average of 45%, with a maximum of 50% at the start of the period, and a minimum of 38%. The delay in the exit by Great Britain from the eurozone and the economic slowdown observed in the manufacturing sector has led us to limit our positions on equities in the eurozone.

From a marked exposure in American equities (38%) at the start of the year, we have partially profit taken to lower it to 27% of our equity positions by end March. As the Fed transitioned to a more accommodating policy, we have very progressively increased our exposure during the second quarter to reach 37% by end June. American equities represented on average 33% of equity investments.

Japan was penalized by slowing global trade and a strong Chinese yen, and our balancing dropped from 4% to 2%.

Emerging markets, with a preference for China, represented up to 22% of our investments. We have been reducing our positions since early April. Our global emerging position is maintained at around 13%, with a preference for developed Asia in April and May. We slightly increased our positions in China and introduced North Korea in June.

Along with our gold balancings, we traded the ageing demographics thematic in favour of automation and robotics. Positions in gold securities were liquidated at end June at the highest price for an ounce of gold.

Equity investment vehicles

The European compartment largely contributed to the portfolio's performance, except during May. The best performance came from funds profiting from growth: **HSBC GIF Euroland Growth** (22.7%), while unlisted securities funds were penalized for their large stakes in banking (**HSBC GIF Euroland Equity** 14.5%, **ETF Lyxor MSCI EMU Value** 10.8%). With the slowdown in growth, we have invested in a fund with quality securities (**iShares Edge MSCI ERP Quality**, 18.2%) and reduced our positions in the weak volatility fund **MSCI Europe Min Vol** (14.6%).

HSBC SELECT EQUITY MUTUAL FUND

Our exposure to American equities was largely profitable thanks to the choice of vehicles: **Invesco EQQQ Nasdaq** (22.2% in EUR), **iShares MSCI US Quality** (21.2% in EUR) and **iShares Edge S&P 500 Min Vol** (20.5% in EUR).

Emerging countries contributed less: **iShares Core MSCI EM IMI** (11.2% in EUR); **HSBC Gif Frontier Markets** (18.2% in EUR); **HSBC MSCI China** (12.6% in EUR).

Bond allocation compartment

In the interest rate compartment, bond yields still seem too low for us and insufficiently compensate the inherent rising rate risk, especially for European government bonds.

Our investments were limited to emerging debt, which largely contributed, along with dollar debt funds (**HSBC GIF Global Emerging Markets Bond** 9.6%, hedged in EUR) and local currency ones (**HSBC GIF Global Emerging Markets Local Debt** 7.6% in EUR).

Performance

HSBC SELECT EQUITY	6 month perf
HSBC SELECT EQUITY (A) (C) (EUR)	13.64%
HSBC SELECT EQUITY (B) (C) (EUR)	13.99%

Past performance is no guarantee of future performance.

Incidents affecting the Fund during the financial year or forthcoming

11 February 2019 – Regulatory update and other changes

We inform you of the implementation of new regulatory obligations in accordance with various successive AMF directives:

- Added to the section “Form of units,” without amending the actual process, a clarification concerning unit subscriptions in registered form.
- Added to the table “Description and redemption methods” editorial changes stipulating notably the settlement dates of subscriptions and redemptions.
- Added to Article 3 of the rule on the notice regarding the provisional or definitive cessation of the issuance of the unit.

14 June 2019 – Stipulations on the composition of assets and other modifications

We inform you that the Fund whose units are listed below was subject to the following changes:

- Unit A (ISIN code: FR0007036900),
- Unit H (ISIN code: FR0011883289),
- Unit B (ISIN code: FR0013313988).

HSBC SELECT EQUITY MUTUAL FUND

In the composition of the Fund's assets:

- added to the potential option of investing in foreign index and/or tracker investment funds up to 10% of assets,
- deletion of the term "*principally*" referring to investment funds of the HSBC Group; now investment funds selected may be managed by an HSBC Group entity but more than primarily;

Added from the London and New York exchanges, the regular calculation of the NAV shall occur on each trading day, with the exception of legal holidays in France, closing days on French markets (official Euronext Paris SA calendar) or in London (official LSE calendar) and New York (official NYSE calendar);

Harmonisation of the settlement deadlines related to the subscription and redemption requests: the execution deadline of redemption request settlements is reduced from 3 to 2 working days (D+2) following the date of establishment of the NAV, except for IT units.

The KIID and Fund prospectus have also been editorially harmonised.

There is no effect on the management strategy of the Fund and does not require a request for approval from the AMF.

HSBC Select Equity

Certification from the registered auditor on the asset mix as of 28 June 2019

To the Management Company:

In our capacity as registered auditor for the HSBC Select Equity mutual fund and in application of the regulatory provisions in force pursuant to the monitoring of the asset mix, we have issued this certification on the information appearing in the asset mix as of 28 June 2019 attached.

This information was issued under the responsibility of the management company. It is our duty to provide our opinion on the consistency of the information in the asset mix with the knowledge that we have on the investment fund based on our mission of auditing the annual statements.

We have taken the due diligence that we deemed consistent with the professional code of the French national body of auditors (CNCC) regarding this mission. This due diligence which concerned neither an audit nor a limited review consisted essentially of completing analytical procedures and meetings with persons who produced and monitored the information provided.

On the basis of our work, we have no opinion to offer on the consistency of information appearing in the document which is attached with the knowledge that we have of the investment fund based on our mission of auditing the annual statements.

Paris, La Défense, 23 August 2019
